Ugne Ankenaite

A visually appealing poster with novel outcomes for advancing human health quantitative risk assessment through the application of robust scientific method.

A very well presented and visually appealing poster. The author has used multiple lines of evidence to support risk-based decision making and effective communication with the regulators.

Esteban Forero

Sophie Sharrock

A well laid out and presented poster. The explanation of the application of best practice and the comparison to typical practice shows how adopting different methods can affect risk assessment conservatism.

A good example of the use of more complex models in performing quantitative risk assessment whilst recognising data limits and uncertainties that might underpin and affect decision making.

Gemma Shaw

Georgia Malin

Demonstrates the

challenges in determining a

conceptual site model for

ground gas, including

identifying the key sources

and pathways, to allow a

suitable and robust risk

assessment to be

completed.

Presents a new area of research which could have importance for fate and transport modelling and could lead to modifications of current models in the future.
